Aside from its formation from equal parts of d-and /-limonene, it is obtained synthetically by polymerization of the unsaturated aliphatic hydrocarbon isoprene, C₅H₈; also, together with terpinene, upon dehydration of the aliphatic alcohols linalool and geraniol. Furthermore, it results upon isomerization of other hydrocarbons C₁₀H₁₆, e.g. pinene, limonene, phellandrene; also by inducing the proper changes in related oxygenated compounds, such as cineol, terpineol, and terpinhydrate. Dipentene, together with cineol and limonene, was also obtained by the action of nitrous acid on fenchylamine. A relatively pure dipentene can be obtained by the dry distillation of caoutchouc. After the removal of the isoprene, fraction 172 to 178 is carefully and repeatedly fractionated over sodium. The presence of any cineol, which has a like boiling point, can be ascertained by a corresponding increase in the specific gravity. A less pure preparation can be obtained from dipentene dihydrochloride by splitting off hydrogen chloride with aniline or sodium acetate in glacial acetic acid;1) also by the dehydration of crystalline terpineol by means of potassium acid sulphate. -) Physically, dipentene differs from limonene only by its optical inactivity. The boiling point of pure dipentene appears to be the) Wallach, Liebig s Annalen 239...
